The reality—

2016: What happens in an internet minute?

ONE INTERNET MINUTE

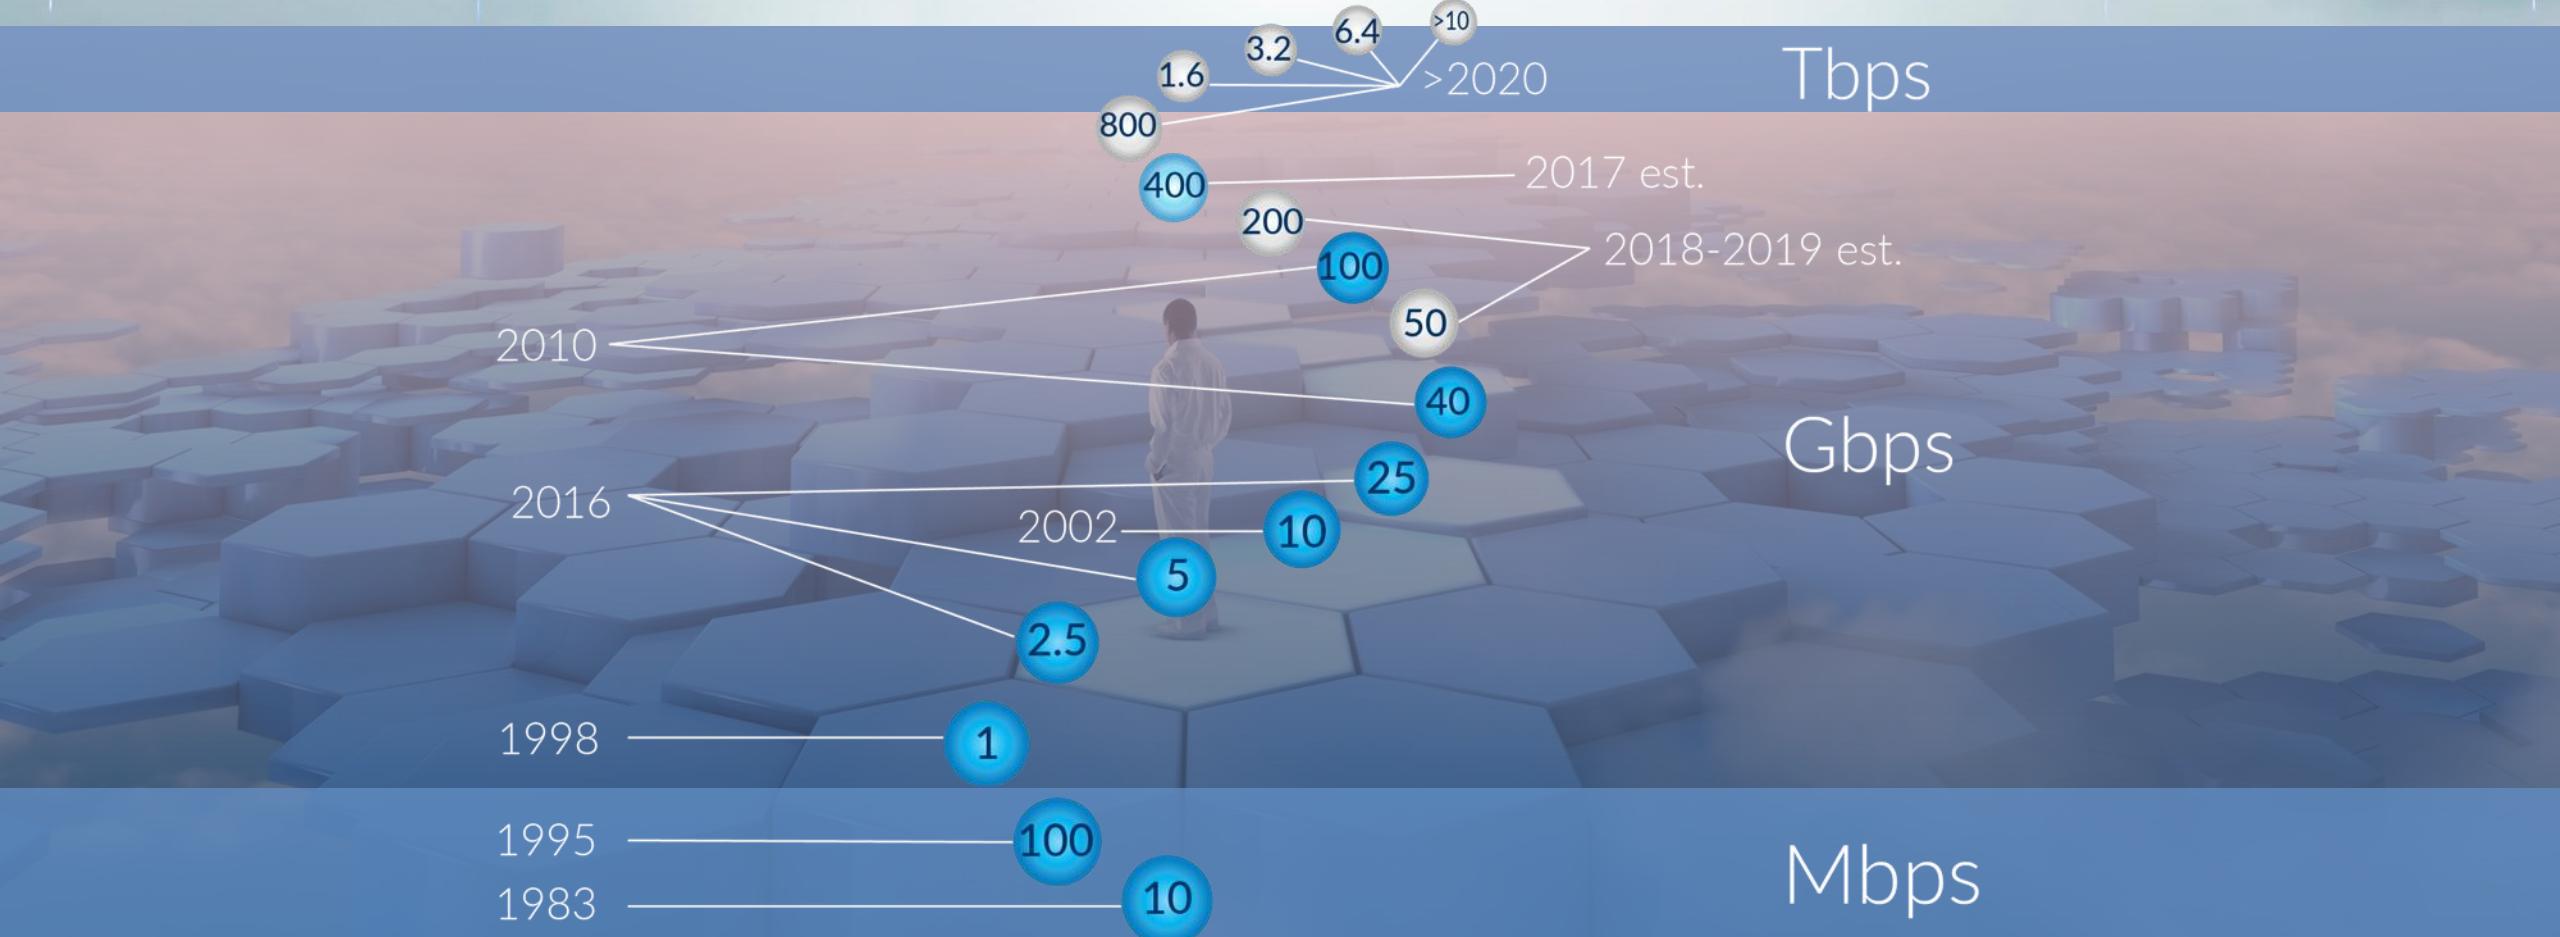

The challenge

Adapt your data center infrastructure in order to:

- Increase equipment port count and fiber density
- Support faster lane capacities
- Reduce latency
- Prepare to migrate to higher speeds

A roadmap exists...

...but the path forward is anything but straight

● Ethernet speed

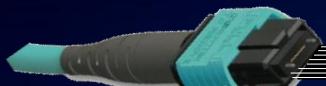

● Speed in development

● Possible future speed

Ethernet Roadmap and Transmission Initial Standards (2010)

Parallel

40GBASE-SR4

100GBASE-SR10

Duplex

10GBASE-SR
10GBASE-LRM
10GBASE-LX4

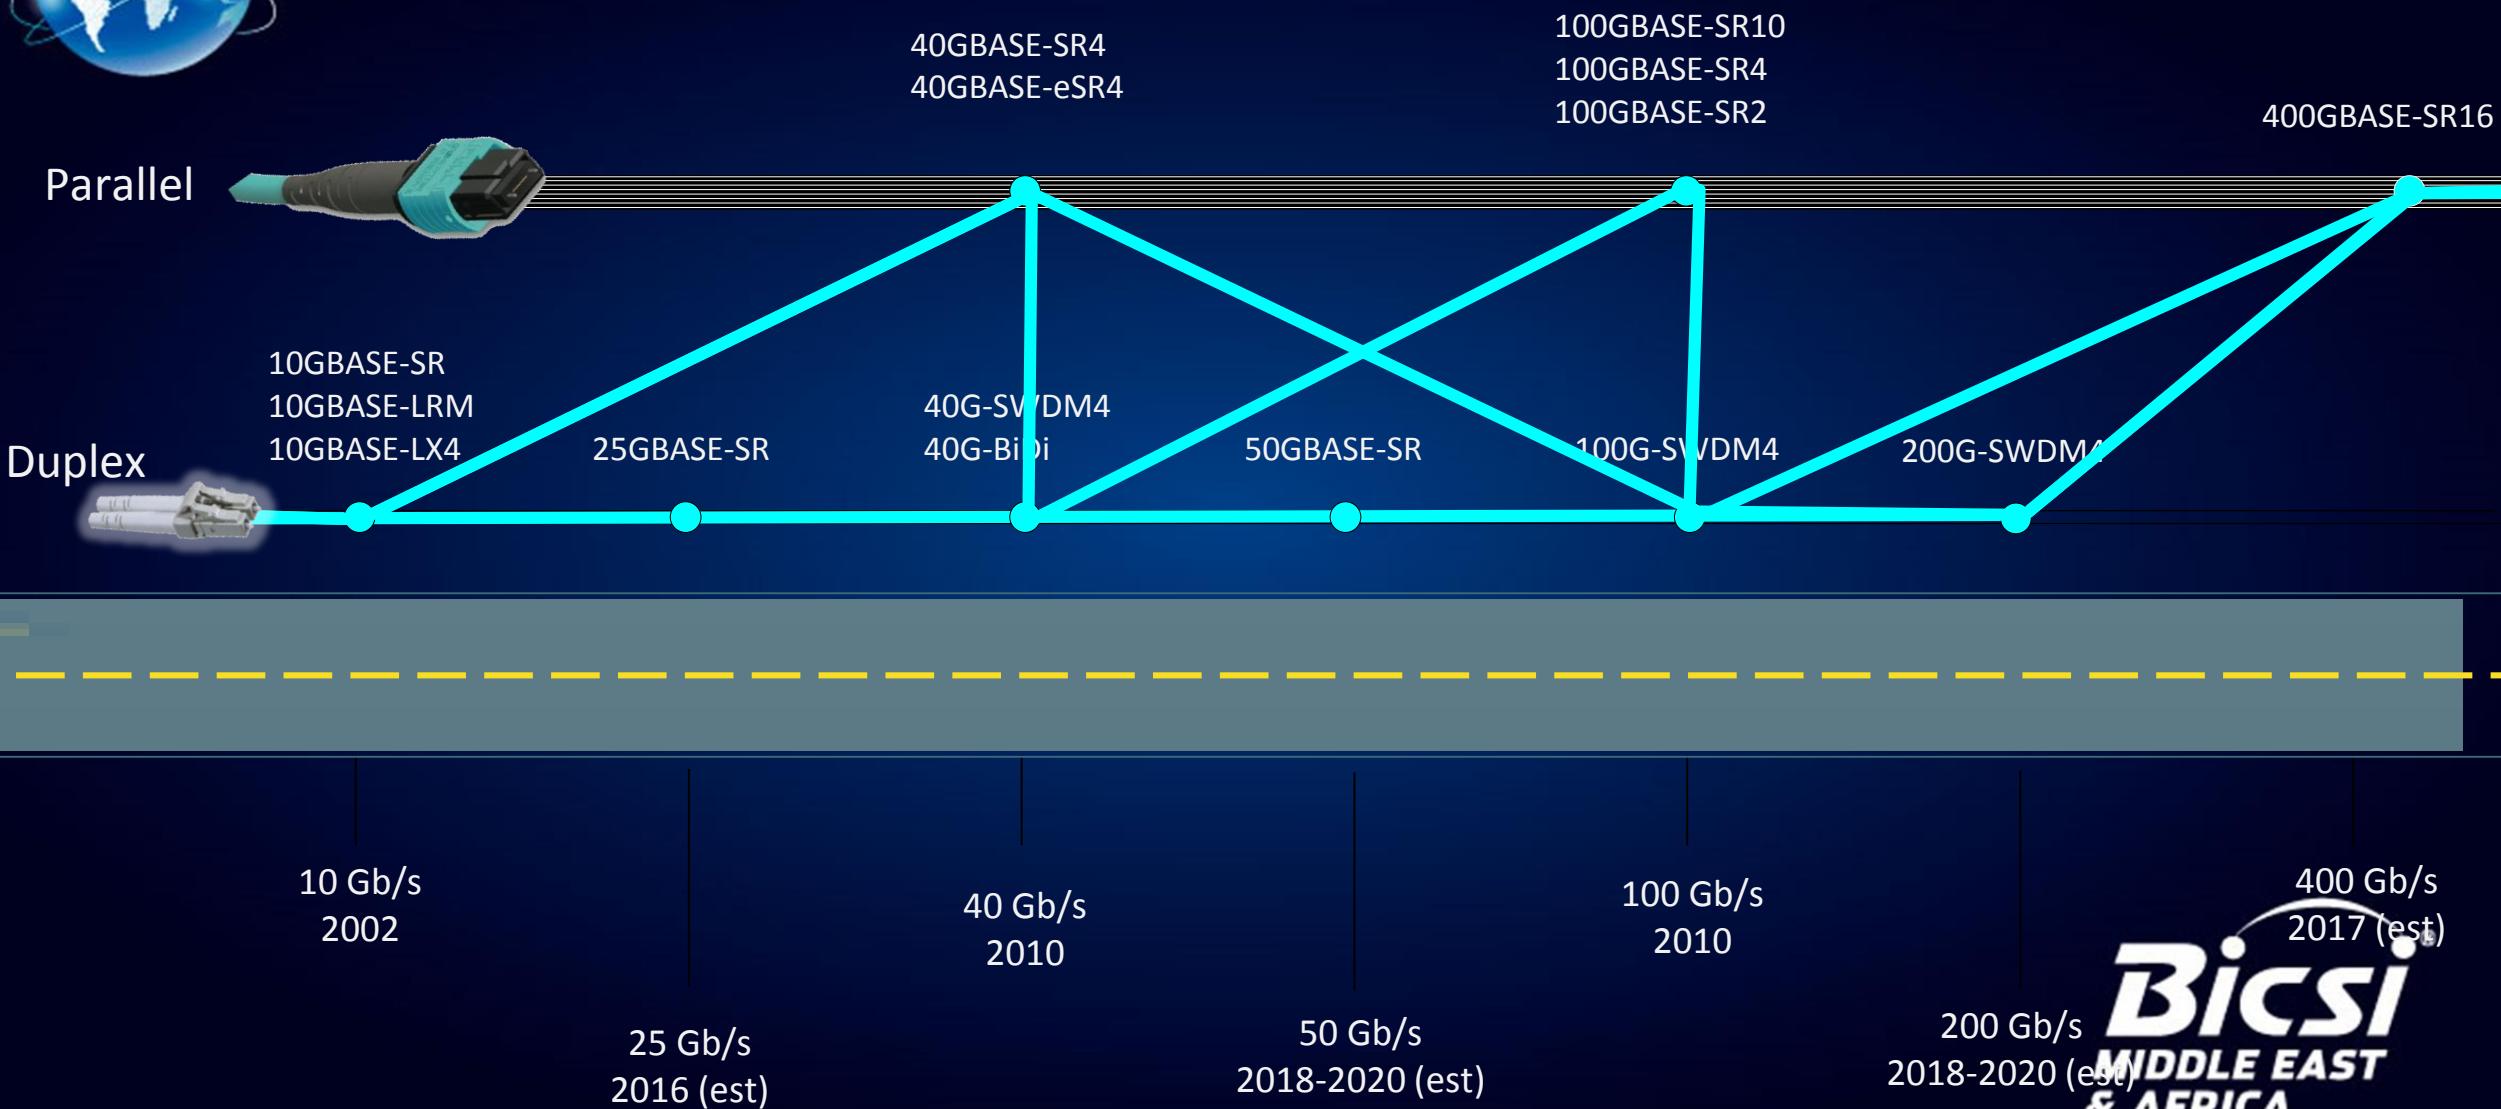

10 Gb/s
2002

40 Gb/s
2010

100 Gb/s

Many options for moving between duplex and parallel

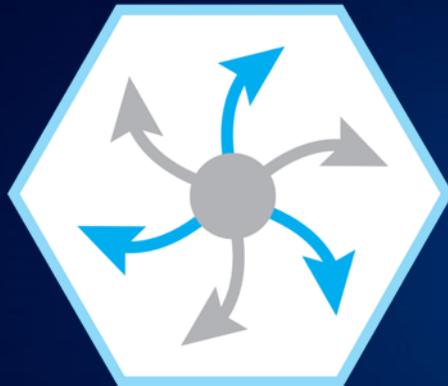

Which way?

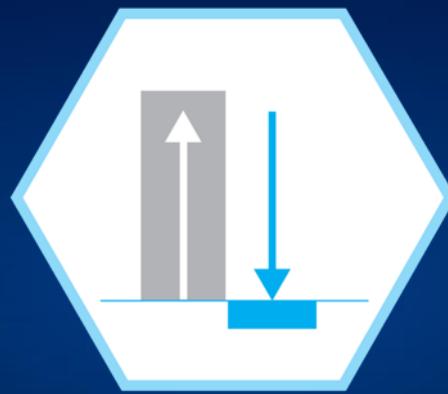

- 8-fiber, 12-fiber, 24-fiber...which MPO?
- 25G/50G is in—40G is ?
- Optics: duplex, parallel or both?
- WBMMF, a game changer

Your network infrastructure must be:

Agile & Flexible

High Density & Ultra-Low
Loss

Cloud Friendly

Agile, flexible and future ready

- ***Respond to sudden and unexpected changes*** with easy to use panels, modules, fiber and connectors
- ***Support emerging applications with optimal fiber configuration*** with a complete portfolio of single and multimode fiber and connector options for all major MPO fiber configurations

MPO-24

MPO-8

MPO-12

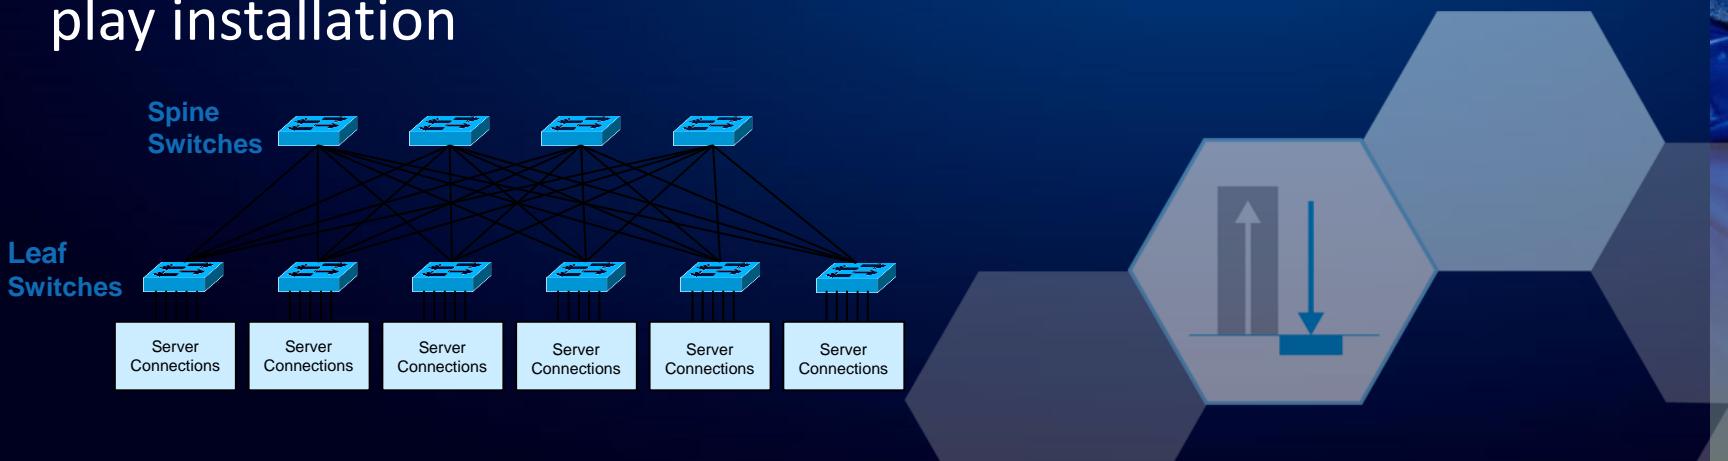

Higher speeds - minimal redesign

- ***Evolve at your own speed with singlemode or multimode optics***—modular components support 25-, 40-, 50-, 100-, 400 Gbps and beyond
- ***Support advanced, attenuation-sensitive technologies***—end-to-end links with multimode ultra-low-loss fiber solutions
- ***Increase scalability***— OM5 WideBand (MMF) quadruples capacity while maintaining legacy duplex multimode fiber architectures

Higher density - easier management and lower costs

- ***Support the fiber and equipment port density required*** for leaf-and-spine networks with high- and ultra-high density fiber panels that keep link connections accessible and manageable
- ***Reduce the time, cost and risk of moves, adds, and changes*** with pre-terminated connectivity and plug-and-play installation

Blueprint for a long-term migration strategy

Create an agile, manageable and fiber-dense infrastructure that can support higher-speed applications and technologies as they continue to evolve—scaling easily with minimal disruption.

HIGH-SPEED MIGRATION COMPONENTS

Fiber panels, cables and connectors

- **High-density (HD): 48 duplex LC or 32 MPO ports per RU**
- **Ultra-high density (UD): 72 duplex LC or 48 MPO ports per RU**
 - Both support singlemode, OM4 and OM5 multimode
 - G2 compatible modules and adapter packs
- **OM5 WideBand multimode:** Enables shortwave division multiplexing and increases capacity by a factor of four
- **Ultra-low loss pre-terminated cable:** Supports longer link spans and the infrastructure design needed for guaranteed operational availability
- **G.657.A2 singlemode:** Delivers lowest bend losses—for macro- as well as micro-bending
- **Wide range of MPO configurations:** 8-, 12- and 24-fiber
- **24-fiber MPO ensures lowest “first cost” duplex deployment**

Example Migration from Duplex to Parallel – OM4

10GBASE-SR – 2 fibres

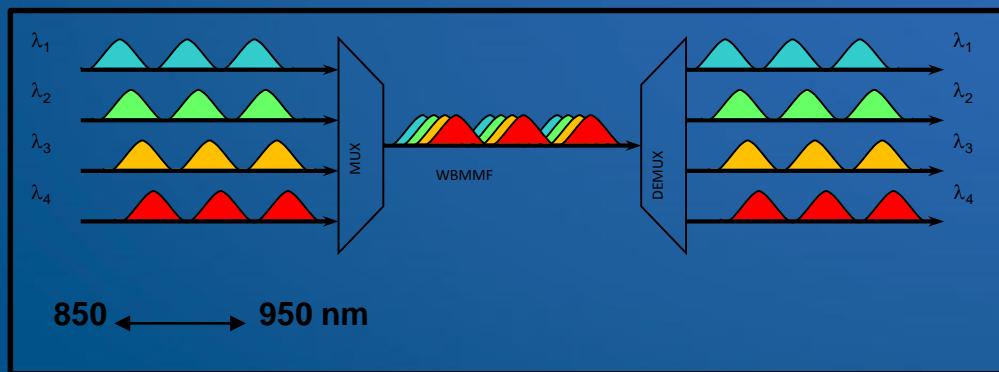

100GBASE-SR4 – 8 fibres

Multimode Fiber Evolution OM5 – Wave Division Multiplexing

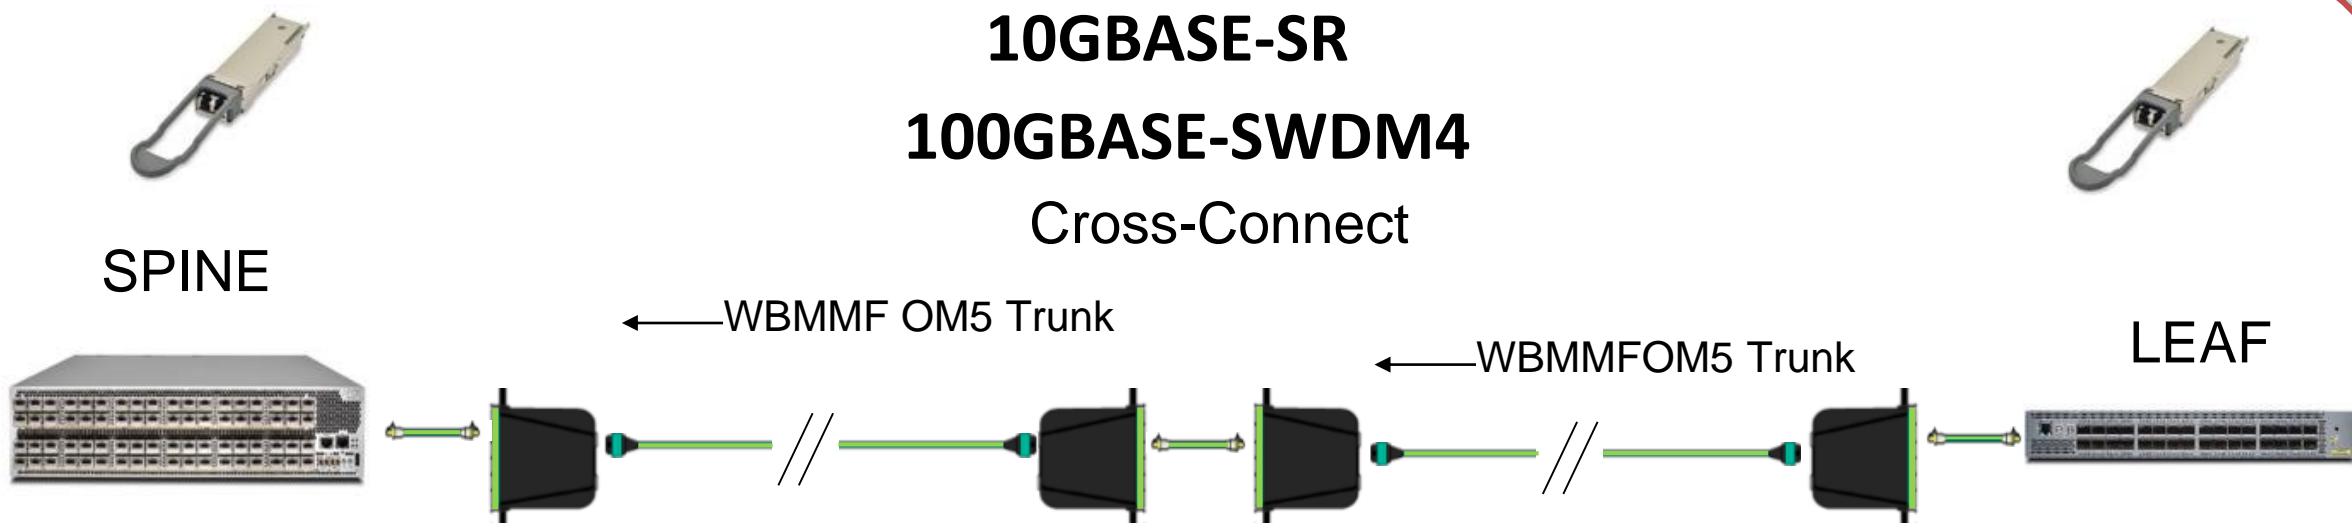

- Multiple wavelengths reduce # of fibers
- Need sufficient BW over spectrum
 - 4 wavelengths over a single fibre
 - 25nm spacing for low-cost WDM

SPEED	10G Parallel TX RX	25G Parallel TX RX	25G Parallel w/ WDM TX RX
40G	N/A	N/A	
100G			
400G	N/A		

Migration from 10G to 100G with SWDM and WBMMF OM5

All cabling is retained (continues to require only 2 strands)
